LOADS

MAXIMUM SUGGESTED LOADS

Type of support On the line of the two ends of the panel
--

Limits determined by **Deflection** (load sagging)

the maximum deflection admitted, is 1/200 of the distance between the supports

According to the standard DIN 24537-3 deviation due to the load may be no more than 1/200 of the land width and the difference in height between neighbouring joints between loaded and unloaded floor coverings may be no more than 4 mm.

DISTRIBUTED LOAD			CONCENTRATED LOAD		
Distance between	Load with	Load with	Distance between	Load with	Load with
supports	deflection equal	deflection equal	supports	deflection equal	deflection equal
	to 1/200	to 1/100		to 1/200	to 1/100
[cm]	[kg/m²]		[cm]	[cm]	
50	5350	10700	50	1650	3350
70	1950	3900	70	850	1700
90	900	1800	90	500	1000
110	500	1000	110	300	650

All lighter loads are admitted

Limits determined by Admitted stresses (stress determined by the load)

the **maximum admitted stress** is 1/5 of the ultimate stress (safety factor is equal to 0.20 – the ultimate stress is 5 times the specified load)

DISTRIBUTED LOAD		CONCENTRATED LOAD		
Distance between supports	Maximum admitted load	Distance between supports	Maximum admitted load	
[cm]	[kg/m²]	[cm]	[kg/m]	
50	12450	50	3100	
70	6350	70	2200	
90	3800	90	1700	
110	2550	110	1400	

- The above characteristics are meant as reference values for standard material in ambient working temperature. Even if they are not to be considered as guaranteed characteristics they are based on our experience and are supplied in good faith.
- According to the standard DIN 24537-3 the conversion safety factor should be 0.75 for internal environmental exposure conditions, 0.65 for external exposure conditions, and 0.50 for aggressive exposure conditions.
- No matter which are the exposure conditions, chemical resistance must be always verified by contacting M.M. technical department.
- In case of heavy duty load compressive strength must be verified.
