LOADS

MAXIMUM SUGGESTED LOADS

Type of support	On the line of the two ends of the panel
Limits determined by	Deflection (load sagging)
the maximum deflection admitted , is 1/200 of the distance between the supports	
According to the standard DIN 24537-3 deviation due to the load may be no more than 1/200 of the land width and the difference in height between neighbouring joints between loaded and unloaded floor coverings may be no more than 4 mm.	

DISTIBUTED LOAD			CONCENTRATED LOAD			
	Distance between supports	Load with deflection equal to 1/200		Load with deflection equal to 1/100	Distance between supports	Load with deflection equal to 1/200
	[cm]	[kg/m ²]		[cm]	[kg/m]	
	70	10850	21750	70	4750	9500
	90	5100	10200	90	2850	5750
	110	2800	5600	110	1900	3850
	130	1650	3350	130	1350	2750
All lighter loads are admitted						

Limits determined by	Admitted stresses (stress determined by the load)
the maximum admitted stress is 1/5 of the ultimate stress (safety factor is equal to 0.20 – the ultimate stress is 5 times the specified load)	

DISTIBUTED LOAD			CONCENTRATED LOAD		
	Distance between supports	Maximum admitted load		Distance between supports	Maximum admitted load
	[cm]	[kg/m ²]	[cm]	[kg/m]	
	70	9450	70	3300	
	90	5700	90	2550	
	110	3800	110	2100	
	130	2750	130	1750	
All lighter loads are admitted					

- The above characteristics are meant as reference values for standard material in ambient working temperature. Even if they are not to be considered as guaranteed characteristics they are based on our experience and are supplied in good faith.
- According to the standard DIN 24537-3 the conversion safety factor should be 0.75 for internal environmental exposure conditions, 0.65 for external exposure conditions, and 0.50 for aggressive exposure conditions.
- No matter which are the exposure conditions, chemical resistance must be always verified by contacting M.M.technical department.
- In case of heavy duty load compressive strength must be verified.
