LOADS

MAXIMUM SUGGESTED LOADS

Type of support	On the line of the two ends of the panel

Limits determined by **Deflection** (load sagging)

the maximum deflection admitted, is 1/200 of the distance between the supports

According to the standard DIN 24537-3 deviation due to the load may be no more than 1/200 of the land width and the difference in height between neighbouring joints between loaded and unloaded floor coverings may be no more than 4 mm.

DISTRIBUTED LOAD			CONCENTRATED LOAD		
Distance between supports	Load with deflection equal to 1/200	Load with deflection equal to 1/100	Distance between supports	Load with deflection equal to 1/200	Load with deflection equal to 1/100
[cm]	[kg/m²]		[cm]	[kg	/m]
50	3800	7600	50	1150	2350
70	1350	2750	70	600	1200
90	650	1300	90	350	700
110	350	700	110	200	450

All lighter loads are admitted

Limits determined by Admitted stresses (stress determined by the load)

the **maximum admitted stress** is 1/5 of the ultimate stress (safety factor is equal to 0.20 – the ultimate stress is 5 times the specified load)

DISTRIBUTED LOAD		CONCENTRATED LOAD		
Distance between supports	Maximum admitted load	Distance between supports	Maximum admitted load	
[cm]	[kg/m²]	[cm]	[kg/m]	
50	6950	50	1700	
70	3550	70	1200	
90 2150		90	950	
110	1400	110	750	

- The above characteristics are meant as reference values for standard material in ambient working temperature. Even if they are not to be considered as guaranteed characteristics they are based on our experience and are supplied in good faith.
- According to the standard DIN 24537-3 the conversion safety factor should be 0.75 for internal environmental exposure conditions, 0.65 for external exposure conditions, and 0.50 for aggressive exposure conditions.
- No matter which are the exposure conditions, chemical resistance must be always verified by contacting M.M.technical department.
- In case of heavy duty load compressive strength must be verified.
